DATA SHEET - RESCUE MAN BASKET

Crane man baskets

Rescue man basket

Emergency evacuation basket

This crane basket is suitable for safely managing emergency operations at height. Often used in earthquake-affected areas, the crane-suspended basket offers the possibility to reach and rescue injured individuals stranded at higher elevations, facilitating their transportation to the ground without risks. Thanks to its spacious dimensions, the basket allows for the comfortable transport of 4 persons in an upright position and one on a stretcher. In order to minimize the risk of uncontrolled oscillations of the basket, four hooks are positioned on the roof, ensuring a secure attachment to the crane and facilitating movement in total safety. The sheet metal walls further contribute to reducing the danger of getting caught in branches during outdoor operations. The crane basket has been designed to meet all requirements arising from the "essential safety requirements". In accordance with the UNI EN 14502 standard (lifting appliances - equipment for lifting persons) and Legislative Decree 09/04/2008 no. 81, Annex VI point 3.1.4, it will be the responsibility of the safety manager to assess its suitability for specific use. The structure, made of steel and painted with a powder finish, comes complete with emergency stickers.
