Lifting clamps for sheets

The lifting clamps for sheets simplify handling operations thanks to their lightweight and maneuverable construction, while also providing convenient handles for maneuvering and orienting the load according to your needs. It is recommended to always use them in opposing pairs, with four-arm chain slings of adequate length. These brackets are particularly suitable for the metalworking sector, allowing for the rapid lifting of even thick sheet metal packs due to their wide gripping capacity, without the need for a spreader bar. In addition to the available standard versions, we can develop customized equipment based on the dimensions and specific weight of the sheet metal packs you intend to lift. Please communicate your needs to us, and we will be happy to offer you a tailored solution.
